Detailed Vulnerability Breakdown

IP: 45.33.32.156 | Service: Apache httpd | Version: 2.4.7

CPE: cpe:2.3:a:apache:http_server:2.4.7:*:*:*:*:*

CVE ID: CVE-2007-4723

Severity: HIGH | CVSS: 7.5

Description: Directory traversal vulnerability in Ragnarok Online Control Panel 4.3.4a, when the Apache HTTP Server is used, allows remote attackers to bypass authentication via directory traversal sequences in a URI that ends with the name of a publicly available page, as demonstrated by a "/...../" sequence and an account_manage.php/login.php final component for reaching the protected account_manage.php page.

More Info: <http://osvdb.org/45879>

CVE ID: CVE-2009-0796

Severity: LOW | CVSS: 2.6

Description: Cross-site scripting (XSS) vulnerability in Status.pm in Apache::Status and Apache2::Status in mod_perl1 and mod_perl2 for the Apache HTTP Server, when /perl-status is accessible, allows remote attackers to inject arbitrary web script or HTML via the URI.

More Info: <http://lists.apple.com/archives/security-announce/2010//Nov/msg00000.html>

CVE ID: CVE-2009-2299

Severity: MEDIUM | CVSS: 5.0

Description: The Artofdefence Hyperguard Web Application Firewall (WAF) module before 2.5.5-11635, 3.0 before 3.0.3-11636, and 3.1 before 3.1.1-11637, a module for the Apache HTTP Server, allows remote attackers to cause a denial of service (memory consumption) via an HTTP request with a large Content-Length value but no POST data.

More Info: <http://secunia.com/advisories/35645>

CVE ID: CVE-2011-1176

Severity: MEDIUM | CVSS: 4.3

Description: The configuration merger in itk.c in the Steinar H. Gunderson mpm-itk Multi-Processing Module 2.2.11-01 and 2.2.11-02 for the Apache HTTP Server does not properly handle certain configuration sections that specify NiceValue but not AssignUserID, which might allow remote attackers to gain privileges by leveraging the root uid and root gid of an mpm-itk process.

More Info: <http://bugs.debian.org/cgi-bin/bugreport.cgi?bug=618857>

CVE ID: CVE-2011-2688

Severity: HIGH | CVSS: 7.5

Description: SQL injection vulnerability in mysql/mysql-auth.pl in the mod_authnz_external module 3.2.5 and earlier for the Apache HTTP Server allows remote attackers to execute arbitrary SQL commands via the user field.

More Info: <http://anders.fix.no/software/#unix>

IP: 45.33.32.156 | Service: Nping echo | Version: Unknown

CPE: New

CVE ID: Predicted CPE

Severity: HIGH | CVSS: 8.0827

Description: FTP servers can allow an attacker to connect to arbitrary ports on machines other than the FTP client, aka FTP bounce.

More Info: Unknown

CVE ID: Predicted CPE

Severity: HIGH | CVSS: 7.6830

Description: getcwd() file descriptor leak in FTP.

More Info: Unknown

CVE ID: Predicted CPE

Severity: HIGH | CVSS: 7.4929

Description: Remote attackers can cause a denial of service in FTP by issuing multiple PASV commands, causing the server to run out of available ports.

[More Info: Unknown](#)

CVE ID: Predicted CPE

Severity: HIGH | CVSS: 7.3868

Description: Buffer overflow in nftp FTP client version 1.40 allows remote malicious FTP servers to cause a denial of service, and possibly execute arbitrary commands, via a long response string.

[More Info: Unknown](#)

CVE ID: Predicted CPE

Severity: HIGH | CVSS: 7.2829

Description: gFTP FTP client 1.13, and other versions before 2.0.0, records a password in plaintext in (1) the log window, or (2) in a log file.

[More Info: Unknown](#)

Executive Summary & Recommendations

High-Level Overview:

The network consists of multiple services running on various ports, including an Apache HTTP server, an Nping echo, and an unknown service. The Apache server and Nping echo service have several vulnerabilities, some of which are high severity.

Key Risks by Severity:

1. High Severity:

- CVE-2007-4723: Directory traversal vulnerability in the Apache HTTP server. This could allow remote attackers to bypass authentication.
- CVE-2011-2688: SQL injection vulnerability in the Apache HTTP server. This could allow remote attackers to execute arbitrary SQL commands.
- Predicted CPE vulnerabilities in Nping echo service: These include FTP bounce, file descriptor leak, denial of service through multiple PASV commands, buffer overflow, and plaintext password recording. These could allow remote attackers to connect to arbitrary ports, cause denial of service, and possibly execute arbitrary commands.

2. Medium Severity:

- CVE-2009-2299 and CVE-2011-1176: These vulnerabilities in the Apache HTTP server could allow remote attackers to cause a denial of service and potentially gain privileges.

3. Low Severity:

- CVE-2009-0796: Cross-site scripting (XSS) vulnerability in the Apache HTTP server. This could allow remote attackers to inject arbitrary web script or HTML.

Recommendations:

1. Patching: Apply patches for all the identified vulnerabilities on the Apache HTTP server and Nping echo

service. This includes patches for CVE-2007-4723, CVE-2009-0796, CVE-2009-2299, CVE-2011-1176, and CVE-2011-2688.

2. Updates: Update the Apache HTTP server and Nping echo service to the latest versions to mitigate the risk of vulnerabilities.

3. Isolation: Isolate the services until the patches are applied to prevent potential attacks.

4. Security Configuration: Ensure that the Apache HTTP server and Nping echo service are configured securely. For example, disable unnecessary features, use strong authentication mechanisms, and restrict access to sensitive resources.

Suspicious or Critical:

The presence of high-severity vulnerabilities in the Apache HTTP server and Nping echo service is critical. If exploited, these vulnerabilities could lead to unauthorized access, data loss, or service disruption. The unknown service running on port 31337 is suspicious and should be investigated further.
